

# AGRICULTURAL AND FORESTRY EXPERIMENT STATION

---

The Agricultural and Forestry Experiment Station (AFES) conducts research to enhance the quality of life in Alaska through development of natural, economic and human resources. Research emphasizes factors typical of high latitudes and is designed to provide the information and technology needed to manage renewable resources for the economic and social well-being of Alaskans. This work includes studies of natural and manipulated ecosystems, sustainable soil productivity, food production, food security and genetics for improved plant productivity. Additional research involves economic and legal aspects of resource use, silviculture and forest management, resource use for tourism and recreation, and education and communications in resources management.

AFES, in cooperation with state and federal agencies, conducts research at sites in Fairbanks, Palmer, Delta Junction, Nenana and Nome. AFES faculty have research sites within the Long-Term Ecological Research program funded by the National Science Foundation. This research, which is determining the structure and function of northern boreal forest ecosystems, forms the basis for sustainable forest management practices.

AFES researchers represent the disciplines of agronomy, forestry, horticulture, land use planning, outdoor recreation, plant pathology, resource policy and law and soil science. For more information, visit the AFES website (<https://www.uaf.edu/afes/>) or call 907-474-5211.
